Water Saving Garden

Identify

One of the most common problems facing gardeners in Australia today is when soils dry out, becoming water repellent, or hydrophobic. When this happens, water just runs off instead of soaking into the soil. This happens in sandy soils and often caused by uncomposted mulches sitting on the surface and drying out soil particles.

Fix

Applying a soil wetter will assist water penetration, reducing water run off and help eliminate dry patches. Water is helped into the soil, encouraging deeper root growth so that less frequent watering is required. A good soil wetter can significantly reduce water usage. EZI-WET® has the following added benefits:

- It has an added organic plant food Charlie Carp
- It contains natural bentonite clay - a well known water saver
- It is economical with a 10kg bag treating up to 300m²
- It bears two known water saving accreditations: Smart Approved WaterMark and it is also Waterwise Approved.

Maintain

Keep your garden healthy by using a soil wetter regularly as part of your gardening routine. For gardens and lawns add a soil wetter every 6-8 weeks in Spring and Summer and every 8-12 weeks in Autumn and Winter. For pots and baskets apply twice a year at the start of Spring and at the start of Autumn.
