

eco-naturalure[®]

FRUIT FLY BAIT CONCENTRATE

eco-naturalure DIRECTIONS FOR USE

Spraying should commence early as fruit can be stung when young and green. In fruit fly areas start spraying when fruit is 1cm diameter or when the **eco-lure** monitoring trap starts catching flies.

SITUATION	RATE	HOW TO APPLY
Foliage	10 ml in 60 ml of water	Apply as coarse droplets in 30 cm ² patches around trees and plants. 70 ml of solution will make approximately 9 patches. Reapply every 7 days and immediately after rain. Rotate patch positions each week. No withholding period.
Non-foliage baiting	10 ml in 15 ml of water	Apply as coarse droplets to a 30cm ² non-absorbent board and hang mid-canopy amongst foliage. Reapply every 7 days and immediately after rain. No withholding period.

If the solution runs off the leaves or board add less water until it is thick enough to stick. Some water must be added to activate the product. Diluted solution will not store. Mix up fresh each time. Mango and pear skins are sensitive to the spray and may burn. Avoid spraying this fruit directly.

eco-naturalure[®]

FRUIT FLY BAIT CONCENTRATE

eco-naturalure is a Registered Organic product that attracts and kills both male and female fruit flies. **eco-naturalure** contains specific food attractants that appeal to both Queensland and Mediterranean (Medfly) fruit flies as well as an organic insecticide which kills the fruit flies when eaten.

Applied weekly as a spot spray **eco-naturalure** is an easy organic way to protect fruit and vegetables from these destructive pests.

eco-naturalure WHAT MAKES IT DIFFERENT?

- Works on Queensland and Mediterranean fruit flies
- Attracts and kills both male and female flies
- Registered Organic (Australian Organic)
- No withholding period
- Easy to apply as a spot spray (no need to spray entire tree/plant)
- Safe for beneficial insects and other animals

eco-naturalure BEATING FRUIT FLY

Fruit fly populations are increasing across Australia as our winters become milder and people neglect their fruiting plants. Following are some tips to win the war:

- Set up monitoring traps (*see below*).
- Start spraying **eco-naturalure** when males first appear in the trap or when fruit is 1cm diameter. Flies are becoming active earlier each year and will sting rock hard green fruit. Spraying early will prevent their numbers escalating later in the season.
- Apply as large coarse droplets, not a fine mist. This helps the product stay moist for longer and remain attractive to the flies.
- Spray around chicken pens and compost bins as these areas will also attract fruit flies.
- Clean up fallen fruit immediately and seal in plastic bags. Place in the bin or leave in the sun for several days to kill any maggots and then compost them.

eco-lure MALE QUEENSLAND FRUIT FLY TRAPS

The **eco-lure** trap should be hung around foliage at the beginning of the fruit fly season. The wick contains a sex pheromone that attracts male Queensland fruit flies and an insecticide which rapidly kills them. The insecticide is not organic but is contained within the trap. Check trap regularly and once flies appear start spraying **eco-naturalure** to protect fruit. Wicks should be replaced every 3 months.

eco-lure trap is only effective on Queensland fruit fly and will not work on Medfly in Western Australia.
